PREFACE

This Code of Practice provides guidelines for the design, installation, testing and commissioning, operation and maintenance of LPG filling stations. This Code shall be read in conjunction with the Gas Safety Ordinance (Cap. 51) and the subsidiary regulations. (See Appendix A for reference)

The basis of this Code includes: -

- Australian/New Zealand Standard AS/NZS 1596 - Storage and Handling of LP Gas by Standards Australia and Standards New Zealand
- Code of Practice No. 20 - Automotive LPG Refuelling Facilities by the LP Gas Association of United Kingdom
- Regulations for LPG Service Stations and Road Tank Trucks in the Netherlands by the Dutch Ministry of Housing, Physical Planning and Environment
- Other relevant international standards on LPG filling stations

While this Code tends to be specific in important aspects affecting safety and reliability, it shall be seen as offering guidance to engineers, operators and other users who will continue to exercise judgement and skill in the fulfilment of their obligations. It shall be borne in mind that practice may need changes with emerging technology and experience. The requirements listed in this document shall not be regarded as a set of rigid rules that cannot be changed. It is expected that the document will be reviewed and updated as required.

J  Annual Inspection Report of LPG Filling Station (Form 109A)

K  Summary of Tests, Examinations and Inspections
SECTION 1. INTERPRETATION OF TERMS

**Aboveground tank** - A bulk tank which is located above ground level and not covered by sand or earth.

**Bulk tank** - A receptacle for storing LPG with a water capacity of more than 450 litres.

**Competent person** - A person who is competent by virtue of his/her training and substantial practical experience to perform/supervise/inspect/certify LPG installation, testing, and maintenance work (see Appendix B1 or B2).

*Note*: The list of competent persons is obtainable from the Gas Standards Office and any registered gas supply companies supplying LPG.

**Excess-flow valve** - A device designed to close when the liquid or vapour passing through it exceeds a prescribed flow rate.

**Flameproof enclosure** - A type of protection in which the parts, which can ignite an explosive atmosphere, are placed in an enclosure which can withstand the pressure developed during an internal explosion of an explosive mixture, and which prevents the transmission of the explosion to the explosive atmosphere surrounding the enclosure.

**Gas Authority** - The authority appointed under Section 5 of the Gas Safety Ordinance (Cap. 51).

**Gas Standards Office (GasSO)** - An office within government which is under the control of the Gas Authority to administer the Gas Safety Ordinance (Cap. 51).

**Hazardous area** - An area in which an explosive gas atmosphere is, or may be expected to be, present in quantities such as to require special precautions for the construction, installation and use of electrical apparatus.

**Hot work** - Welding or the use of any flame or electric arc or the use of any equipment likely to cause heat, flame or spark. It also includes caulking, chipping, drilling, rivetting and any other heat producing operation, unless it is carried out in such a way as keep the temperature of the tools and work below 100°C.

**Installation boundary** - Boundary of LPG filling station.

**Intrinsically safe** - Confining electrical energy to the installed system so that a hazardous environment cannot be ignited; and protecting the integrity of the circuit from intrusion of energy from other electrical sources so that the safe energy limitation in the circuit is not exceeded, even when breaking, shorting or earthing of the circuit occurs.

**LPG** - Liquefied petroleum gas as defined under the Gas Safety Ordinance (Cap. 51).

**Notifiable gas installation (NGI)** - An installation, as defined in the Gas Safety (Gas Supply) Regulations, including all LPG filling stations.
**Major gas emergency** - “major gas emergency” as defined under the Gas Safety (Registration of Gas Supply Companies) regulations (Cap.51).

**Off-loading** - Transferring LPG from road tankers to bulk tanks.

**Piping system** - A system made up of pipes, tubings, valves and fittings, etc. for conveying LPG in either liquid or vapour state at various pressures from one point to another.

**LPG pressure, high** - A pressure of more than 69 kPa  
**medium** - A pressure of between 6.9 kPa and 69 kPa  
**low** - A pressure of not more than 6.9 kPa  

*Note: These pressures are specific for LPG and not the same as those stipulated in the Gas Safety Ordinance.*

**Pressure relief valve** - A valve designed for preventing a rise of internal pressure in excess of a specified value due to emergency or abnormal conditions.

**Purging** - Replacing the content in a system by inert gas before putting it into or out of service.

**Road tanker** - A motor vehicle designed and constructed for the conveyance of LPG in bulk on roads.

**Safe area (non-hazardous area)** - An area in which a flammable gas mixture is not expected to be present in quantities such as to require special precautions for the construction, installation and use of electrical apparatus.

**Source of ignition** - Material, devices or equipment which, because of their modes of use or operation, are capable of providing sufficient thermal energy to ignite a flammable gas mixture when in contact with them.

**Tanker bay** - An area of the LPG filling station where a road tanker is parked during off-loading operations.

**Underground tank** - A bulk tank which is located below ground level and covered with sand or earth.

**Water capacity** - The amount of water in volumetric units at 15.6°C required to fill a container completely.
SECTION 2. INTRODUCTION AND SCOPE

2.1 Introduction

This Code has been prepared as a general outline of the minimum safety standards to be followed by owners of LPG filling stations for the design, construction, testing & commissioning, operation and maintenance of LPG filling stations and also, in carrying on their business, to ensure the health and safety at work of their employees and to conduct their operations in a safe manner so that members of the public are not exposed to undue risks from gas.

2.2 Scope

2.2.1 This Code of Practice covers the design, location, installation, testing and commissioning, operation and maintenance of the LPG storage and dispensing facilities at filling stations where LPG is used as a vehicle fuel. It encompasses tanks, submersible pumps, dispensers, fittings, pipework within the stations, off-loading facilities, electrical equipment, fire protection, site layout and fence.

2.2.2 The design and installation requirements in this Code shall, unless specified otherwise, apply to new installations and major alterations to LPG filling stations only, of which the applications for construction approval are made after the issue of this Code. The operation and maintenance requirements in this Code and the incident handling requirements shall apply to all new and existing installations.

Note: SI units shall be used for new installations. Other units are also permitted with SI units in brackets.

2.3 Regulations and References

2.3.1 All LPG gas installations shall comply with local statutory safety requirements. Particular reference shall be made to:

The Gas Safety Ordinance (Cap. 51)
The Gas Safety (Gas Quality) Regulations (Cap. 51)
The Gas Safety (Gas Supply) Regulations (Cap. 51)
The Gas Safety (Miscellaneous) Regulations (Cap. 51)
The Gas Safety (Registration of Gas Supply Companies) Regulations (Cap. 51)
The Buildings Ordinance (Cap. 123)
The Dangerous Goods Ordinance (Cap. 295)
The Fire Services Ordinance (Cap. 95)
Air Pollution Control Ordinance (Cap. 311)
Noise Control Ordinance (Cap. 400)
Waste Disposal Ordinance (Cap. 354)
Water Pollution Control Ordinance (Cap. 358)
Road Traffic Ordinance (Cap 374)
Town Planning Ordinance (Cap 131)

2.3.2 This Code makes reference to the following publications (latest editions of these publications shall be used in each case):

**ANSI/ASME – American National Standards Institute/American Society of Mechanical Engineers**
- ASME Boiler & Pressure Vessel Code Section VIII – Pressure vessels
- ASME B1.5 ACME screw threads
- ANSI B16.5, Piped flanges and flange fittings, steel nickel alloy and other special alloys
- ANSI B16.9, Factory Made Wrought Steel Butt-welding Fittings
- ANSI B16.11, Forged Steel Fittings, Socket-Welding and Threaded

**ANSI/ASTM – American National Standards Institute/American Society for Testing & Materials**
- ASTM A53, Specification for pipe, steel, black and hot-dipped, zinc-coated, welded and seamless

**API – American Petroleum Institute**
- API 607, Fire Test for Soft-seated Quarter-Turn Valves

**AS – Standards Australia**
- AS 1210, SAA Unfired Pressure Vessel Codes
- AS 1596: 1989 – LP Gas – Storage and Handling

**BSI – British Standards Institution**
- BS 470, Specification for inspection, access and entry openings for pressure vessels
- BS 1387, Specification for screwed and socketed steel tubes and tubulars and for plain end steel tubes suitable for welding or for screwing to BS 21 pipe threads
- BS 1560, Circular flanges for pipes, valves and fittings
- BS 1600, Specification for dimensions of steel pipe for the petroleum industry
BS 1965, Specification for butt-welding pipe fittings for pressure purposes
BS EN 1563, Founding – Spheroidal graphite cast irons
BS EN 1564, Founding – Austempered ductile cast irons
BS EN 1057, Copper and copper alloys.
BS 3601, Specification for carbon steel pipes and tubes with specified room temperature properties for pressure purposes
BS 3605, Austenitic stainless steel pipes and tubes for pressure purpose
BS 3799, Specification for steel pipe fittings, screwed and socket welding for the petroleum industry
BS 4250, Specification for commercial butane and commercial propane
BS 4882, Specification for bolting for flanges and pressure containing purposes
BS 5423, Specification for portable fire extinguishers
BS EN 60529, Specification for degrees of protection provided by enclosures
PD 5500, Specification for unfired fusion welded pressure vessels
BS 5501, Electrical apparatus for potentially explosive atmospheres
BS EN 60079, Electrical apparatus for explosive gas atmospheres

Code of Practice for Minimum Fire Service Installations and Equipment, HKSAR
SECTION 3. STATUTORY REQUIREMENTS

3.1 Construction and Use Approval

3.1.1 An LPG filling station is classified as a Notifiable Gas Installation as defined under the Gas Safety Ordinance Cap.51. According to Regulations 3 to 6 of the Gas Safety (Gas Supply) Regulations, construction and use approvals are required by the Gas Authority (i.e. The Director of Electrical and Mechanical Services). The Gas Authority will examine in details the design, installation, operation and maintenance of the stations to ensure that they are in compliance with all safety regulations, standards and codes of practice as stipulated by the Gas Authority.

3.1.2 The construction and use approvals would not deem to confer any title to land or to act as a waiver of any term in any lease or license or any approval from other authorities. In particular, any person who intends to carry out building works is required by law to appoint an authorized person, and where necessary a registered structural engineer, to prepare and submit plans for the approval of Building Authority under the Buildings Ordinance Cap.123.

3.1.3 Application of construction approval of an LPG filling station shall be submitted in writing to the Gas Authority by using Form EMSD/GSO/104 with the following documentation and a prescribed fee (Refer to Schedule 1 of Gas Safety (Gas Supply) Regulations) for consideration:-

a) Quantitative Risk Assessment report for the LPG station (Refer to Section 3.3).
b) Design and calculation of the lightning protection system.
c) Design and calculation of cathodic protection system.
d) Type, quantity and location of fire fighting equipment.
e) A list of all gas fittings, equipments and machinery to form part of, or to be used in connection with the installation.
f) Specifications for the LPG pumps, dispensers, gas detectors and breakaway couplings.
g) Testing and commissioning procedures of the LPG installation.
h) A copy of the owner’s HKID card/Business Registration Certificate.
i) Two copies of drawings providing the following information :-
   - Elevation and sectional views of the LPG filling station with all dimensions clearly specified.
   - LPG piping layout (including depth of cover, type of protection, etc.).
   - Schematic LPG piping diagram of the LPG installation.
   - Schematic piping diagram of the pneumatic system within the LPG installation.
   - Layout plan showing positions of gas detectors and emergency switches.
   - Installation details of the LPG tank(s).
   - Plans showing fire service installations (if such plans have not been submitted to the Building Authority).
j) Other relevant information if requested.
3.1.4 Application of use approval of an LPG filling station shall be submitted in writing to the Gas Authority by using Form EMSD/GSO/105 with the following documentation and a prescribed fee (Refer to Schedule 1 of Gas Safety (Gas Supply) Regulations) for consideration. Before applying for approval of use, the applicant should have obtained the construction approval from the Gas Authority and have completed all the construction work.

a) Pipework pressure test certificate.
b) Pressure relief valves pressure test certificates.
c) Use approval of the LPG tank from the Gas Authority.
d) Cathodic protection system test report.
e) Earthing impedance report.
f) Electrical continuity test certificate for LPG pipework.
g) Test report for electrical isolation of insulation flange.
h) Test report for emergency shut down system.
i) Test report/certificate for lightning protection system.
j) Work completion certificate for fixed electrical installations (WR1).
k) Calibration certificate for pressure gauges, thermometers (if fitted).
l) Certificate of flameproof type for electrical installations and equipment used in hazardous areas (including LPG pumps and dispensers).
m) Calibration, inspection and test certificate for gas detection system.

n) Certificate of Fire Service Installations and Equipment (F.S. 251) of fire service installations/gas detectors, and a Fire Services Certificate (FS 172) or an acceptance letter/memo issued by the Director of Fire Services.
o) Testing and commissioning programme of the LPG installation.
p) Other relevant information if requested.

3.1.5 The owner of the station shall not put the installation into use unless use approval in writing has been obtained from the Gas Authority and the construction work has been completed. The testing and commissioning shall be completed satisfactorily in accordance with the requirements of Section 7 and relevant report shall be submitted to the Gas Authority before the station is allowed to commence operation to the public for refuelling LPG vehicles.

3.2 Type Approval of LPG Storage Tank

Under Regulation 7 of the Gas Safety (Gas Supply) Regulations, the type approval of LPG storage tank shall be obtained from the Gas Authority before putting the tank into use. Form EMSD/GSO/110 & Form EMSD/GSO/111 with the documents as prescribed in the form shall be submitted for this application.

3.3 Quantitative Risk Assessment (QRA)

By virtue of its bulk LPG storage and filling activities, a Quantitative Risk Assessment (QRA) report is required for an LPG filling station as a part of the construction approval process. The owner of the
LPG filling station has to employ an independent risk assessment consultant to prepare a QRA report to demonstrate that the risk levels associated with the station are in compliance with relevant sections about the Risk Guidelines in the Hong Kong Planning Standards and Guidelines. The QRA report should take into account bulk LPG storage, interaction of LPG and other flammable fuels, site topography, meteorological conditions, ignition sources, and existing and planned population in the vicinity of the filling station.

3.4 Maintenance Responsibility

According to Regulation 6B of the Gas Safety (Gas Supply) Regulations, the owner of the LPG filling station has the responsibility to ensure that the station and the equipment therein are operated and maintained in a safe manner.
SECTION 4. SITING REQUIREMENTS

Note: This Section shall be read in conjunction with section about Petrol Filling Stations in “Hong Kong Planning Standards and Guidelines” issued by the Planning Department.

4.1 General

This section sets out the siting and minimum separation distance requirements for LPG filling stations from adjacent buildings from a risk point of view. It also outlines the minimum separation distance requirements between LPG and petrol/diesel filling facilities for compliance.

4.2 Location

4.2.1 Sites for LPG filling stations shall be located to provide suitable distances away from habitable areas as the orientation of the property allows. In addition, they shall be sited on open ground and situated in locations which are well ventilated and which, so far as can be reasonably foreseen, will remain so, even on subsequent development of adjacent sites.

4.2.2 An LPG filling station should be located along designated main roads which are considered to be safe for LPG transport, or at location which can be easily reached from these main roads without passing through highly populated areas.

4.2.3 Nullah/manhole should not be situated in close proximity to the filling station.

4.3 Site Layout

4.3.1 The layout of an LPG filling station should be designed in such a way so as:
   a) to minimise the likelihood of impact onto an LPG road tanker by vehicles while it is entering or leaving the site;
   b) to take into consideration of road width, gradient, turning radius, line of sight, traffic volume and vehicle speed;
   c) to provide convenient access and egress for the road tanker;
   d) to enable the road tanker and all other refilling vehicles to drive into and out of the site in a forward direction without having to reverse into the site from the main road;
   e) to provide a designated parking area large enough for the road tanker during unloading operation;
   f) to provide designated areas for dispensing bays;
   g) to provide adequate illumination around the dispensing area of the forecourt and road tanker unloading area for safety purposes at all times of use;
   h) to avoid the underground tank(s) located underneath the traffic path or road tanker bay; and
   i) to provide a Price Information Board for prominent display of retail price.
4.4 Physical Dimensions of LPG Filling Station

A minimum size of 750 m$^2$ will normally be required for a new filling station but not necessarily for an existing petrol filling station retrofitted with LPG filling facilities. The plot size of the filling station would depend on location, storage quantity, number of dispensers, and side-activities such as car washing facilities and should be referred to the Hong Kong Planning Standards and Guidelines for details. In addition, it should comply with the minimum separation distance requirements from surrounding buildings as set out in Clause 4.5 and among filling facilities as in Clause 4.6.

4.5 Separation Distances from Surrounding Buildings

LPG filling facilities should fulfill the separation requirements from surrounding buildings as specified in the following table. However, the final separation requirements should be subject to the Quantitative Risk Assessment report as in Clause 3.3.

<table>

Note:
(i) **Incidental dwelling** includes small houses dispersed over a large area and ribbon development.  
(ii) **Commercial/Industrial** includes commercial developments, supermarkets, hotels, guest houses, shops, business premises, industrial buildings, factories and workshops, etc.  
(iii) **Recreational** includes recreational facilities, swimming pools, sports fields, playgrounds, etc.  
(iv) **Residential** includes high-rise residential buildings of regular occupancy.  
(v) **Institution** includes establishments for schools, hospitals, senior citizens, child-care facilities, etc.

4.6 Separation Distance between LPG and Petrol/Diesel Filling Facilities

The minimum separation distance requirements between LPG and petrol/diesel filling facilities are shown in the following table. If a radiation wall constructed of non-combustible material and with 2-hour fire resistance rating in accordance with the Code of Practice for Fire Resisting Construction issued by Buildings Department or equivalent is provided, the separation distances can be suitably reduced by measuring round the edge of the wall. The height of radiation walls shall be at least 1.8m. A radiation wall may be built on a boundary, but in such a case, it shall be wholly under the control of the owner of the station.

The distance between the LPG tank and the installation boundary shall be at least 1.5m and the vessel chamber around the LPG tank shall be wholly within the installation boundary.
A typical layout of LPG filling station with separation distance requirements is shown in Appendix E.

### 4.7 Fire Service Requirements

Building plans including the fire service installations should be submitted to the Building Authority for approval under the Buildings Ordinance Cap.123. In case there is no building works and plans are not submitted to the Building Authority, plans showing fire service installations should be submitted to the Gas Authority. The owners of petrol-cum-LPG filling stations and dedicated LPG filling stations shall comply with the fire service requirements as set out by the Director of Fire Services and/or the Gas Authority. For easy reference, some of the requirements are stipulated in Section 10.
SECTION 5. DESIGN

5.1 General

5.1.1 All equipment used in the LPG filling station shall be suitable for the conditions of use, e.g. temperature, pressure, compatibility, area classification, etc. and should be easily accessible for maintenance and fire-fighting purposes.

5.1.2 Cast-iron equipment and components shall not be used for LPG installations. Other materials such as bronze, brass, copper, etc. that are confirmed as suitable for LPG service may be used.

5.1.3 All rubber components shall be of a grade and quality suitable for LPG service.

5.1.4 Pressure-containing parts shall be made of steel, nodular iron, malleable iron or brass. Where nodular iron is used, it shall be in accordance with BS EN 1563 or BS EN 1564 or equivalent. Internal parts and components shall be corrosion resistant.

5.1.5 The grading of an LPG filling station shall be such that LPG spillage will not collect beneath a parked road tanker.

5.1.6 The drainage system of the LPG filling station shall be adequately designed to prevent the ingress of any LPG releases into the public drain.

5.1.7 Tanker and dispensing bays shall be designed for effective draining of rain and fire fighting water. If the drainage system connects to a public drain, there shall be an LPG trap incorporated into the design to prevent any LPG releases from entering the public drains. See Appendix C for typical design for an LPG trap.

5.1.8 Drains and pits shall be avoided in the immediate vicinity of 3 m of the LPG storage tank, dispenser or extended fill-connection. Where the drains and pits are unavoidable within this distance, the openings shall either be securely covered or suitably sealed.

5.1.9 Crash barriers should be provided at appropriate locations to prevent the above-ground connections of the LPG storage tank and dispenser from collision by vehicles.

5.1.10 Schematic diagram for a typical LPG filling station is shown in Appendix D.

5.1.11 No illegal shades should be provided over any open yard.

5.2 LPG Storage Tank

5.2.1 Under normal circumstances, only underground LPG tank (of total storage capacity below 25 tonnes) with submersible pumps should be used at an LPG filling station. Each tank shall be painted with a corrosion resistant coating, provided with cathodic protection system and put underground inside a concrete chamber which is filled with washed sand.

5.2.2 Double-tank arrangement should be considered to eliminate disruption of LPG supply when one tank is out of service.

5.2.3 The LPG storage tank shall not be installed in basements or pits.

5.2.4 The LPG storage tank shall not be installed closer than 7 m to any vessel or bund wall of vessels containing other flammable liquid with a flash point below 65°C.

5.2.5 The distance between the LPG storage tank and the boundary of filling station should be at least 1.5 m.
5.2.6 The extended fill-connection, valve assembly and submersible pump set on the manhole of any LPG storage tank shall be at least 7.6m from adjacent buildings, station boundary where the general public have legitimate access or any fixed sources of ignition.

5.2.7 The LPG storage tank shall be designed and constructed in accordance with PD 5500 or equivalent, such as AS 1210 or ANSI/ASME Boiler & Pressure Vessel Code Section VIII. Use of partial standards shall not be allowed.

5.2.8 The LPG storage tank shall be designed to a minimum pressure of 1.725 MPa and a minimum design temperature of -10 °C to 50 °C with a minimum of 1 mm additional wall thickness for corrosion allowance.

5.2.9 The LPG storage tank shall be fully stress relieved and shall be subject to 100% radiography examination and a satisfactory “Charpy” test at minimum design temperature.

5.2.10 The steel used in LPG storage tank shall be certified by the manufacturer as satisfying the design code for LPG service.

5.2.11 An information plate shall be securely fixed to the LPG storage tank at a clearly visible location which shall contain the following information:
   a) manufacturer and serial number;
   b) date of manufacture;
   c) design code;
   d) water capacity in kilolitres;
   e) maximum working pressure in kPa;
   f) design temperature range in degree centigrade - minimum and maximum;
   g) the test pressure and date of test; and
   h) marking of inspecting authority.

Sufficient space shall be provided to mark subsequent retest dates.

5.2.12 The LPG storage tank shall be provided with steel saddles for mounting on concrete footings.

5.2.13 The LPG storage tank supports shall be designed to provide sufficient clearance for operating bottom drain connections if applicable.

5.2.14 The LPG storage tank shall be provided with a pump well for installing the submersible pump. The pump well shall be designed in accordance with respective design code for the storage tank and in such a way that it can be isolated from the storage tank in case the cover flange is removed and the tank is filled with LPG.

5.2.15 Each LPG storage tank shall be provided with the following valves and fittings and be identified with suitable labels:
   a) pressure relief valve(s);
   b) shut-off valve with closing mechanism and excess flow valve for pump well inlet;
   c) shut-off valve and excess flow valve for pump bypass and dispenser return;
   d) shut-off valve and check valve for LPG filling;
   e) fixed level device connected with pressure gauge;
   f) contents gauge;
   g) vapour balance valve between the pump well and storage tank complete with closing mechanism; and
   h) plugged shut-off valve for drain connection.

5.2.16 The LPG storage tank shall have a manhole or an inspection port for internal inspection. The manhole shall have a minimum diameter of 450 mm for storage tank exceeding 5,000 litres water capacity. For storage tank with manhole in the form of extended nozzle, the manhole diameter shall not be less than 550 mm. All fittings shall be accessible from aboveground level.

5.2.17 All liquid and vapour connections on the LPG storage tank other than those for pressure relief valves, plugged openings and those where the outlet from this connection through the storage
tank shell is not greater than 1.4 mm (No.54 Morse Drill size), shall have fire resistant shut-off valves capable of manual operation located as close as practicable to the LPG storage tank.

**Note:** A fire resistant valve is a valve that would substantially retain fluid under specified temperature conditions. BS 6755 and API 607 give guidelines on fire test for valves.

5.2.18 An excess flow valve or check valve shall be installed in all liquid connections larger than 3.0 mm diameter and in all vapour connections larger than 8.0 mm diameter with the exception of openings for pressure relief valves. Excess flow valves shall be installed inside the tank opening to safeguard its function if the connection is broken outside the bulk tank. The normal closing flow rate of an excess flow valve shall be greater than the anticipated maximum flow rate so as to prevent premature closing.

5.2.19 LPG storage tank shall be provided with a drain connection for removing sediment and water contents. The drain connection shall be fitted with a shut-off valve not more than 50 mm nominal diameter. The outlet shall be blanked or plugged.

5.2.20 The LPG storage tank shall be filled in accordance with Gas Safety (Gas Supply) Regulation 10 which states that the storage tank shall not be full of LPG at a temperature of 52.5°C. As a rule of thumb, bulk tank shall not be filled more than 85% of the tank volume.

5.2.21 Each LPG storage tank shall be equipped with at least two gauges for indicating the quantity of contents, one of which shall be of a fixed liquid level type. The contents gauges shall clearly indicate the amount of contents in % of the tank volume and permanent marking plate shall be provided for the maximum percentage of volumetric capacity that the LPG storage tank is to be filled under any circumstances.

5.2.22 The LPG storage tank shall be provided with a pressure gauge connected to the vapour space of the tank which connection shall be protected either by a tapping reduced internally to a bleed hole not larger than 1.4 mm diameter or by a suitable excess flow valve and shut-off valve.

5.2.23 The contents and pressure gauges shall be arranged such that they can be easily read from above the ground level.

5.2.24 Temperature gauges, where fitted, shall be installed in blind pockets. The pockets shall be in the form of blind tubes of suitable length and strength, oil filled, permanently welded to the LPG storage tank and constructed in accordance with the corresponding storage tank design code.

5.2.25 All components and fittings on the manhole such as submersible pump sets, valve assembly, contents gauge, etc. shall be located in an access pit or housing. The pit shall be provided with suitable means to detect and disperse any build up of LPG vapour and a flush cover which shall be of adequate strength to withstand vehicular loading (if any) and be capable of preventing the entry of water.

5.2.26 Pipework and fittings on the LPG storage tank shall be suitably protected against mechanical damage.

5.2.27 Records of the LPG storage tank shall be kept and updated for the service life of the tank and shall include the following:

a) detailed design drawings including nozzle arrangements and fittings;
b) steel plate mill certificates;
c) weld test reports;
d) welder’s certificates;
e) manufacturer’s certificate of compliance; and
f) all test and inspection certificates.

5.3 **Concrete Chamber for LPG Storage Tank**
5.3.1 Each underground LPG storage tank shall be installed in an individual concrete chamber filled with washed sand and be provided with cathodic protection. The concrete chamber shall be designed to withstand the weight of vehicles and be wholly within the boundary of filling station.

5.3.2 The foundation and footings for each LPG storage tank in the concrete chamber shall be designed to support the total load of the tank fully filled with water.

5.3.3 The strength of anchorage system for the LPG storage tank shall be capable of withstanding the maximum residual floating force of the empty tank in case the concrete chamber is totally flooded.

5.3.4 The LPG storage tank shall be covered with washed sand of a depth of 450mm minimum and reinforced concrete of 150mm minimum in thickness.

5.3.5 The walls of the concrete chamber shall be imperforated and have a thickness of 200mm minimum and 300mm minimum in case of common walls.

5.3.6 The clearance between the LPG storage tank and walls of the concrete chamber shall be of 150 mm minimum but preferably 450 mm for access to the tank for external inspection. Bottom clearance shall not be less than 200mm.

5.3.7 The concrete chamber shall be properly sealed to prevent ingress of water.

5.3.8 Chamber vent pipes shall be provided diagonally in each vessel chamber to allow periodic checks on LPG leakage and ingress of water. The vent pipes shall be extended to a point below the bottom level of the LPG storage tank.

5.3.9 Chamber vent pipes shall be straight and have a nominal bore of 20 mm minimum. Each vent pipe shall be properly capped to prevent ingress of water.

5.4 Corrosion Protection

5.4.1 Exterior surface of the LPG storage tank shall be suitably treated by shot-blasting and be cleaned to exclude all rust, grease and dusts prior to applying surface coating.

5.4.2 Exterior surface of the LPG storage tank shall be covered and bonded with a corrosion resistant coating (see Gas Safety (Gas Supply) Regulation 12(1)) which shall:
   a) provide electrical insulation between the storage tank and the earth;
   b) be inert, non-absorbent to moisture, of high dielectric strength and of sufficient mechanical strength to resist damage during installation; and
   c) have sufficient flexibility to allow for any damage due to expansion or contraction of the storage tank.

5.4.3 Each LPG storage tank shall be protected with a cathodic protection system with a test point for such system (see Gas Safety (Gas Supply) Regulation 12 (1)). The design and construction of the cathodic protection system shall be carried out by experienced corrosion specialists.

5.4.4 Where sacrificial anodes are employed for the cathodic protection system, they shall be provided in accordance with Sections 5.4.5 – 5.4.6.

   Note: For further details, refer to NACE RP-01-69, RP-02-85-95 and CGA OCC-1-1985.

5.4.5 The size and number of anodes shall be designed by experienced corrosion specialists such that the anodes are capable for corrosion protection of the storage tank before its next revalidation date.

5.4.6 The choice of anodes shall be based on the surface area of the LPG storage tank and the test results on the conditions (PH scale, resistivity, etc.) of the washed sand.
Note: The surface potential of the LPG storage tank to be protected shall be more negative than –0.85 volt with reference to a copper/copper sulphate (Cu/CuSO₄) electrode or more negative than +0.25 volt with reference to a zinc electrode.

5.5 Pressure Relief Valve

5.5.1 Each LPG storage tank shall be fitted with pressure relief valve(s) which is set in accordance with a relevant pressure vessel code to which the LPG storage tank is designed. The pressure relief valve shall have the following information stamped on the valve or on a separate metal plate securely fixed to it:

- a) the manufacturer’s identification including make and model or type number, manufacturing date, etc.; and
- b) the pressure at which the valve starts to discharge.

5.5.2 Extra space shall be provided on the valve or the metal plate for subsequent stamping of periodic retest dates.

5.5.3 For multi-port pressure relief valves, any provision made for isolating any relief valve for testing or servicing shall ensure that the remaining relief valves connected to the LPG storage tank are of the same full flow capacity.

5.5.4 Pressure relief valves shall be of a direct spring loaded type or equivalent, be tamper-proof and be constructed in such a way so that breakage of any part shall not in any way lessen the relief function.

5.5.5 LPG should be safely discharged to the atmosphere by means of individual elevated vent pipe at least 3m above ground level and 2m above the LPG storage tank. The bore of the discharge pipe should be sufficiently sized for the full flow characteristics of the relief valves at the discharge point. The vent pipe outlet shall be suitably identified and be provided with a rain cap to prevent ingress of rain water.

5.5.6 Vent pipe outlet shall be located away from fixed source of ignition at a minimum distance of 4.5 m. Electrical fittings within this area shall be in accordance with Section 6.

5.5.7 For underground and mounded LPG storage tanks, the full flow capacity of the pressure relief valves shall be sized as in accordance with the following formula:

\[
A = 3.1965 \times S^{0.82}
\]

Where \( S \) (Surface) = total exterior surface of the tank in \( m^2 \)

\( A \) (Air Flow) = air to be allowed to escape at 15°C and atmospheric pressure in \( m^3/min \)

5.6 Extended Fill-connection

5.6.1 Extended fill-connection should be as close to the LPG storage tank as practicable but not be located inside the access pit of valve assembly. It shall be positioned in such a way to prevent unnecessary bending of the delivery hose from road tanker.

5.6.2 Where more than one LPG storage tank is installed, the filling line for each storage tank shall be separated by valve in the piping system to enable isolation of each tank during operation.

5.6.3 Extended fill-connection shall be within the boundary of filling station.

5.6.4 Extended fill-connection shall be protected against the possibility of mechanical damage by road tankers. Concrete posts, pre-cast concrete curbs or similar barriers shall be used wherever exposure to damage is possible.
5.6.5 A double-check valve shall be installed at the extended fill-connection to prevent the outflow of LPG liquid under abnormal conditions e.g. fill pipe rupture.

5.6.6 Drive-away protection shall be provided in accordance with Regulation 40 of the Gas Safety (Gas Supply) Regulations.

5.7 **Submersible Pump**

A submersible LPG pump of appropriate design to meet the operating characteristics of the filling system and suitable for Zone 0 application shall be installed in the pump well of the LPG storage tank so as to reduce the amount of space required, the chance of tampering and impact by vehicles.

5.8 **Pump By-pass Valve**

A by-pass valve shall be installed in the by-pass line immediately after the discharge valve of submersible pump to control and maintain the differential pressure generated by the pump. The discharge shall be piped back to the LPG storage tank at a pre-determined pressure selected in relation with the pump curve. The function of the by-pass line is to prevent excessive pressure and overheat of the pump.

5.9 **LPG Dispenser**

5.9.1 The LPG dispenser shall be of flameproof type and all components shall comply with the requirements of applicable standards.

5.9.2 The dispenser shall have automatic temperature compensation device to ensure that the quantity of Auto-LPG sold to customers is not affected by variation of ambient temperature.

5.9.3 A vapour return line leading to the vapour space of the LPG storage tank shall be provided for the dispenser.

5.9.4 Remote operated shut-off valves shall be provided for the liquid and vapour return lines of the dispenser.

5.9.5 A pump control mechanism shall be provided in the dispenser such that the submersible pump of the filling system can be switched automatically when the dispensing nozzle is in and out of its receptacle.

5.9.6 Protective shearing device (e.g. breakable glass tube) shall be provided in the dispenser such that upon rupture of the shear provision as in the case of vehicular collision onto dispenser, the whole LPG filling system shall be shut down and the remote-operated shut off valves in the dispenser will actuate automatically to cut off the LPG supply.

5.9.7 A manually operated shut-off valve and excess flow valve shall be provided in the dispenser and as near to the inlet of dispensing hose as practicable between the dispenser cabinet and the breakaway coupling for prevention of leakage of LPG liquid under abnormal conditions, e.g. dispensing hose rupture.

5.9.8 Hose retaining or retrieving mechanism shall be incorporated to protect the hose from touching the ground when not in use.

5.9.9 Other essential components in the dispenser shall include a vapour eliminator to separate vapour from the liquid prior to metering, a meter unit, differential valve, and hydrostatic relief valve.
5.9.10 Schematic diagram for an LPG dispenser is shown in Appendix F.

5.10 **Dispensing Nozzle**

5.10.1 The dispensing nozzle shall be of low emission type, i.e. when the nozzle is uncoupled following a transfer, not more than 4 c.c. of product shall be released to the atmosphere.

5.10.2 The coupling threads shall be of 1¾" x 6 T.P.I. ACME form.

5.10.3 Adequate mechanism should be incorporated in the design of the nozzle such that it cannot be disengaged inadvertently or deliberately during the dispensing operation.

5.10.4 A double-check arrangement or one with single check and dynamic pressure sealing arrangement should be provided at the dispensing nozzle.

5.11 **Breakaway Coupling**

A breakaway coupling shall be provided between the excess flow valve in the dispenser and the outgoing flexible dispensing hose to protect against excessive leakage of LPG liquid in the event the driver drives away the LPG vehicle when the dispensing nozzle is still engaged to the vehicle.

5.12 **Pipework & Fittings**

Note: See also Gas Safety (Gas Supply) Regulation 17 for general statutory requirements for pipework. For the purpose of this code, Regulations 17(1), (2), (3), (5) and (7) are relevant.

5.12.1 Pipework and valve manifold should be routed in open air and aboveground as far as possible, except those routed through traffic path which should be buried underground.

5.12.2 Where reasonably practicable, clearance from other known buried utilities such as electrical cables to the LPG underground pipe should be maintained at not less than 250 mm.

5.12.3 All underground pipework carrying LPG shall be of all welded construction to reduce the chance of leakage.

5.12.4 All LPG pipework and fittings shall be designed for high pressure operation and the pipework shall be of seamless type conforming to ASTM A53, BS 3601 or equivalent.

5.12.5 The number of flanged joints, where necessary, should be kept to a minimum. Only welding neck flanges shall be used. Steel flanges and flanged fittings shall conform to ANSI B 16.5, BS 1560 or equivalent and bolting arrangement to BS 4882 or equivalent.

5.12.6 Joints for pipes above 50 mm shall be butt-welded or socket-welded. Welded connection for pipe fittings shall be in accordance with BS 1965 or equivalent.

5.12.7 Pipe joints up to and including 50 mm nominal diameter may be threaded. Threaded pipes and fittings shall be of heavy wall thickness of Schedule 80 (BS 1600 or equivalent). Threads on both pipes and fittings shall be of tapered form.

5.12.8 Steel socket-welded and screwed fittings and screwed couplings shall be in accordance with BS 3799 or equivalent. Unions shall not be adopted.

5.12.9 Butt-welded fittings shall be forged seamless steel.

5.12.10 Pressure gauges or plugged test points shall be provided at various strategic points of the pipework system for operational use or commissioning. Pressure gauges shall not be provided on liquid LPG pipework except pumping facilities.
5.12.11 Electrostatic precaution shall be in accordance with the requirements stated in Section 6.6.

5.12.12 All underground LPG pipework shall be protected against likely mechanical or vehicular loads by laying at a minimum depth of 1000 mm below ground level with continuous yellow plastic marker tape provided at a minimum of 100mm above the pipe.

5.12.13 Hydrostatic pressure relief valve (HPRV) shall be fitted between any pipe sections where liquid LPG can be trapped (e.g. sections between shut-off valves and blank flanges, pumps between closed suction and discharge valves, etc.) in order to accommodate any thermal expansion.

5.12.14 HPRV should have a pressure rating at a range of 2.4 MPa (350 psig) to 2.75 MPa (400 psig) and shall not be higher than the weakest element in the system.

5.12.15 Adequate means of detecting and dissipating any buildup of LPG vapour should be provided in all underground access pits where the manifolds and shut-off valves of the dispensing system are installed. The access pits shall be provided with flush covers which shall be of adequate strength to withstand vehicular loading (if any) and be capable of preventing the entry of water.

5.13 **Earthing**

All LPG pipework, dispensing hose and dispenser should be effectively connected to earth and bonded to prevent electrostatic accumulation.

5.14 **Remote Emergency Shut-down Button**

Sufficient number of remote emergency shutdown buttons shall be provided at the extended fill-connection, LPG storage tank, dispensing area and sales office for shutting down the whole LPG dispensing system in the event of emergency.

5.15 **Water Spray System**

Water spray system shall be installed as specified in section 10.

5.16 **Gas Detection System**

A gas detection system with adequate number of detector heads at different locations shall be provided for the LPG filling station. The system should give audible alarm when detecting LPG at a concentration 20% of the Lower Flammable Limit and give direct signal to Fire Services Communication Centre when detecting LPG at a concentration 40% of the Lower Flammable Limit. Each detector head should be able to be isolated individually for the purpose of maintenance and testing.
SECTION 6. INSTALLATION

6.1 General

6.1.1 Construction approval from the Gas Authority shall be obtained prior to carrying out any installation work of LPG filling facilities in the filling station (see Section 3.1).

6.1.2 Installation work shall be in accordance with the approved drawings and design requirements as stated in this Code.

6.1.3 Installation work shall be carried out by suitable trained and experienced persons.

6.1.4 LPG installations shall not be used to contain any LPG unless use approval is obtained from the Gas Authority, and that they are commissioned in accordance with the requirements of Section 7. (See Section 3.1)

6.1.5 Installation sites shall be suitably prepared prior to delivery of equipment and installation work.

6.2 LPG Storage Tank

6.2.1 Each LPG storage tank shall be holiday and paint thickness tested (400 \( \mu m \) minimum) over its entire surface and any defects found shall be repaired and retested before burying the tank.

6.2.2 The LPG storage tank shall be installed on firm foundation and shall be secured properly.

6.2.3 Extreme care shall be taken when transporting and handling the storage tank to prevent against accidental damage to the coatings.

6.2.4 Extreme care shall be taken to avoid electrical contact between the LPG storage tank and any steelwork associated with the anchoring system unless included in the cathodic protection system.

6.3 Cathodic Protection

6.2.5 Anodes shall be so placed in washed sand that they are free from any possible contact to other objects.

6.2.6 Reference electrode shall be installed and terminals shall be provided for testing of the cathodic protection system.

6.2.7 Care shall be taken during back-fill to prevent damage to the wiring of the system and undue strain on the electrical connections.

6.2.8 The end of test wires shall be installed in a weatherproof testing box at ground level and be suitably identified.

6.2.9 When installing an earthing system, care shall be taken not to interfere with the cathodic protection system.

6.2.10 As-built drawings and records of the cathodic protection system shall be made after installation and shall include the following data: -

i. quantity, type, size and location of anodes;
ii. date of installation;
iii. type of backfill material; and
iv. resistivity measurement of electrolyte.
These records and subsequent periodic testing results shall be maintained for the service life of the LPG storage tank.

6.4  **Pipework & Fittings**

6.4.1  LPG pipework shall be of welded construction as far as practicable. Welded joints shall be fabricated in accordance with relevant design and welding standards.

Note: *LPGA Code of Practice No.22, NFPA 30A, NFPA 58, CAN/CGA B149.2 or equivalent are applicable.*

6.4.2  Shut-off valves shall be installed to enable isolation of equipment and between lengths of pipework.

6.4.3  All above-ground pipework should be adequately protected against mechanical or vehicular damage.

6.4.4  Before installation, all fittings and pipe sections shall be inspected and cleaned inside to ensure absence of dusts, grease, rust and foreign matters. During installation, precautions shall be taken to prevent pipe connections from contamination. Exposed threads after connection shall be immediately treated and coated against corrosion.

6.4.5  Underground pipework should be wrapped with protective tape against corrosion. Above-ground pipework should be painted and adequately supported. Pipework containing liquid LPG shall be suitably colour coded in blue with the word “Liquid” marked on the surface of the pipework.

6.4.6  Pipework passing through wall or ground slab shall be sleeved and sealed properly with suitable corrosion protection materials.

6.4.7  Pipework layout and supports shall provide adequate allowance to accommodate any movement that may occur due to thermal expansion or contraction of LPG pipework. Distance between pipe supports for vertical and horizontal pipe sections shall be in accordance with the following table:

<table>
<thead>
<tr>
<th>Nominal size (mm)</th>

6.4.8  The discharge outlet of HPRV shall be positioned towards ventilated areas and shall not be directed towards persons, bulk tanks or equipment.

6.4.9  HPRV shall be protected by means of rain cap.
6.5 **Dispenser**

6.5.1 The dispenser and its components shall be installed, tested and commissioned in accordance with manufacturer’s instructions.

6.5.2 The dispenser should be properly anchored to a concrete foundation without straining any connections of its components.

6.5.3 Adequate support should be provided for the dispenser and its components, independent of piping, tubing, or conduit that may be connected.

6.5.4 The remote shut-off valves should be installed below or as close as possible to ground level and below the protective shearing device.

6.5.5 The dispenser should be suitably protected against vehicular damage.

6.5.6 Any voids below the dispenser base should be minimized by backfilling with dry washed sand wherever practicable.

6.5.7 The dispensing hose should be suitably anchored to avoid touching the ground during idle.

6.6 **Electrical Installation**

6.6.1 All electrical equipment shall be properly installed in accordance with manufacturers’ instructions and in compliance with statutory regulations.

6.6.2 Where reasonably practicable, electrical equipment should be located outside hazardous areas, otherwise it shall be of flameproof type and selected, installed and maintained in accordance with BS EN 60079 or equivalent.

6.6.3 Electrical equipment for use in classified zones shall be certified by approval bodies such as BASEEFA in accordance with BS EN 60079 or equivalent.

6.6.4 All electrical wiring and cables for use in classified zones shall be certified by the manufacturer as being suitable for its intended use.

6.6.5 All electrical connections in the dispenser should be made in accordance with the manufacturer’s instructions without negating the integrity of the explosion protection.

6.6.6 The area classifications for LPG filling facilities at the filling station are listed below:

<table>
<thead>
<tr>
<th>Location</th>
<th>Extent of Classified Area</th>
<th>Area Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>LPG storage tank</td>
<td>(a) Within 1.5m in all directions from the tank connections or shell&lt;br&gt;(b) Up to 1.5m above ground level and within 3m from valve assembly and fill connection</td>
<td>Zone 1&lt;br&gt;Zone 2</td>
</tr>
<tr>
<td>Pressure relief valve discharge</td>
<td>(a) Within direct path of discharge. &lt;br&gt;(b) Within 1.5m in all other directions from point of discharge</td>
<td>No fixed electrical equipment&lt;br&gt;Zone 1</td>
</tr>
</tbody>
</table>
Where:

Zone 0 - Area in which an explosive gas-air mixture is continuously present or present for long periods.

Zone 1 - Area in which an explosive gas-air mixture is likely to occur in normal operation.

Zone 2 - Area in which an explosive gas-air mixture is not likely to occur in normal operation and if occurs will only exist for a short time.

6.6.7 LPG storage tank and pipework accessories with cathodic protection system normally should not be earthed, and all outlet connections shall be electrically insulated from the downstream pipework by means of suitable insulation flanges.

6.6.8 An earthing point should be provided at tanker bay for discharging static electricity from road tankers. Earthing points for dissipation of static electricity should have an electrical resistance to earth of not greater that $1 \times 10^6$ ohms.

6.6.9 All pipework and fittings downstream of the insulation flanges shall have electrical continuity and be effectively connected to earth and bonded.
SECTION 7. TESTING AND COMMISSIONING

7.1 General

7.1.1 LPG installations shall be tested and commissioned in accordance with the appropriate standards, codes of practice, drawings, specifications, manuals, etc. Manufacturer reports/catalogues for bulk tanks, submersible pumps, dispensers and equipment, etc. shall also be checked accordingly.

7.1.2 Cathodic protection, earthing, electrical continuity, insulating flange isolation, static bonding arrangements, lightning protection shall be tested in accordance with appropriate standards.

7.1.3 Relevant tests on bulk tanks, submersible pumps, dispensers and associated piping system (See Appendix I 1 or I 2) shall be supervised and certified by a relevant competent person (See Appendix B1 or B2).

7.1.4 All purging, testing and commissioning work shall be carried out by suitably trained and competent persons.

7.1.5 Appropriate personal protective clothing and safety equipment including handheld/portable flammable gas detectors shall be used by people involved with LPG work.

7.1.6 Fire service installations and equipment of the station shall be made available during purging and commissioning work.

7.1.7 All test records and certificates shall be maintained and updated for the service life of the station.

7.2 Documentation and Records

7.2.1 Records and certificates of all tests carried out under this Section shall be retained for the service life of the station.

7.2.2 Test records or certificates should contain, but not limited to, the following information, as appropriate:

a) Form EMSD/GSO/106, Testing and Examination Report of LPG Tank (Appendix I 1);

b) Form EMSD/GSO/108, Testing and Examination Report of LPG Pipes (Appendix I 2);

c) Test Report for Pressure Relief Valves;

d) Test Report for LPG Submersible Pumps;

e) Test Report for LPG Dispensers;

f) Test Report for LPG Control System;

g) Test Report for Emergency Shut-down System;

h) Test Report for Pneumatic System;
i) Test Report for Fire Service Installations including gas detection system such as Certificate of Fire Service Installations and Equipment (F.S. 251);

j) Test Report for Electrical Installations including lightning protection system, earthing, electrical continuity, static bonding arrangement, insulation flange isolation;

k) Cathodic Protection System Test Reports; and

l) Other test reports if required.

7.3 LPG Storage Tank and Submersible Pump Testing

7.3.1 The following tests shall be required for bulk tanks:-

a) hydraulic test;

b) ultrasonic thickness test;

c) radiography test (for new tank only);

d) magnetic particle test;

e) paint thickness test; and

f) holiday test.

7.3.2 Bulk tanks shall be hydraulically tested at 1.5 times of their design pressure, i.e. 2584 kPa (375 psig) for integrity, unless otherwise specified by their respective design code.

7.3.3 All connections of bulk tanks and associated fittings shall be leak tested to a minimum pressure of 689 kPa (100 psig) by air or inert gas (check joints with soap solution).

7.3.4 The LPG submersible pump and the associated control device shall be tested and commissioned in accordance with manufacturer’s instruction.

7.3.5 Functional test of the LPG submersible pumps and insulation test of pump motors shall be carried out.

7.3.6 After leak test, the system shall be purged into service as per Section 7.9.

7.4 Pipework Testing

7.4.1 All pipework shall be tested after construction and before being placed in operation to ensure that it is structurally sound and gas-tight. In carrying out the test, precautions shall be taken to protect :-

a) the person carrying out the test;

b) any persons working in the vicinity; and

c) members of the public,
against any dangers which may arise if such pipe fails the test. (see Regulation 20 of the Gas Safety (Gas Supply) Regulation)

7.4.2 All pipework shall be pressure tested as follows:

a) All pipework shall be hydraulically tested at 1.1 times the HPRV setting, after isolation of elements that could be damaged by the test pressure. Pressure test certificates shall state HPRV setting in addition to hydraulic test pressure.

b) After the hydraulic test is completed, all isolated elements shall be properly installed and the whole system shall be tested pneumatically at a minimum pressure of 1378 kPa (200 psig).

7.4.3 Time shall be allowed for temperature stabilisation during pressure testing. The line pressure shall be adjusted to the test pressure after stabilisation.

Note: The time allowing for temperature stabilisation depends on the ambient temperature, test medium, pipe size and length. Generally this shall not be less than 15 minutes.

7.4.4 For pneumatic testing, the test shall be undertaken in phases as follows:

a) Initially pressurise the system to 140 kPa (20 psig) and hold it for sufficient time to ensure that all fittings have been adequately fastened.

b) The pressure shall then be raised in stages until the required test pressure is reached.

c) After each pressure increase, sufficient time shall be allowed to ensure system integrity.

7.4.5 For hydraulic and pneumatic pressure test, the test period shall be of a minimum of 30 minutes and there shall be no sign of pressure decay during this period. Care should be taken of the pipework which may suddenly rupture due to the pressure test.

Note: Pressure decay indicates leakage and leaks shall then be identified by sight and sound or soap solution.

7.4.6 All open ends of a piping system shall be suitably blanked before testing.

7.4.7 Pipework pressure tests shall be recorded and the test report (See Appendix I 2) shall include the following:

a) name of contractor, and signature of the competent person who supervised the tests;

b) test date;

c) maximum working pressure;

d) test pressure, medium and duration;

e) test results; and

f) material, rating and specification of pipework and fittings.

7.4.8 The pressure of the pipework shall be reduced to zero as soon as is practicable after the pressure tests (see Gas Safety (Gas Supply) Regulation 20). Upon satisfactory completion of
pressure tests, the pipework shall be purged into service in accordance with Section 7.9 prior to commissioning and operation of the LPG installation.

7.5 Dispenser Testing

7.5.1 The dispenser and its components shall be tested and commissioned in accordance with manufacturer’s instructions.

7.5.2 All connections, pipe joints, seals and associated fittings inside the dispenser cabinet shall be subject to leak test carried out by suitably trained and competent person.

7.5.3 The dispensing hose and nozzle shall be subject to leak test carried out by suitably trained and competent person.

7.5.4 The breakaway coupling of the dispensing hose shall be tested to ensure its operating mechanism is in good and efficient working order.

7.5.5 The functional test for the dispensing nozzle hold-open shall be carried out.

7.6 Testing of Remote Emergency Shut-down System

The functional test for remote emergency shut-down system shall be carried out. Each emergency stop button shall be tested to ensure that all pneumatic valves in the station are to be closed and the entire LPG system is to be shut down properly.

7.7 Testing of Gas Detection System

The functional test for gas detection system at appropriate settings as stated in Clause 5.16 shall be carried out.

7.8 Testing of Cathodic Protection System

The cathodic protection system shall be tested according to the procedure as specified by a cathodic protection design consultant.

7.9 Purging into Service

7.9.1 The procedure of purging into service of bulk tanks is as follows (pressure and vent method):

a) After pressure testing of a bulk tank, inert gas (e.g. N₂) is added to the bulk tank until the O₂ content is below 11.4%.

Note: If the medium of pressure test is inert gas, this procedure is not necessary as long as the inert gas is maintained above atmospheric pressure within the bulk tank.

b) Small traces of water may be removed by spraying a small quantity of methanol into the bulk tank.
c) To prevent rapid vaporisation of LPG liquid, only vapour LPG shall be admitted into the bulk tank until the tank pressure is close to the supply pressure.

d) Before the flaring process, the Fire Services Communication Centre (FSCC) of FSD should be informed.

e) A flare stack with a permanent pilot, located in a safe area, shall be connected to a suitable vapour connection for flaring of the LPG/inert gas. Care shall be taken to ensure complete removal of the inert gas (a stable flame at the flare stack) before terminating the flaring process.

f) Introduce vapour LPG into the tank until the tank pressure reaches the vapour pressure of the LPG in the delivery tank.

g) The tank shall be replenished according to Section 8.4.

Note: While flaring is in process, the road tanker shall not be in the LPG filling station.

7.9.2 The procedure for purging into service of pipework (including dispensers and associated equipment) is as follows (ram purge method):

a) Before introducing LPG into the pipework, it shall be purged with inert gas (e.g. N\textsubscript{2}) so that oxygen is reduced to a level of less than 11.4% by volume. Inert gas shall be introduced in a controlled manner by adjusting the pressure regulator.

b) Before putting liquid LPG into the liquid pipework, vapour LPG shall be introduced into the pipework up to the delivery tank pressure in order to avoid sudden chilling of the pipework.

c) For pipework sizes up to 32 mm nominal bore, LPG/inert gas mixture may be dispersed under proper supervision to a well ventilated area without any source of ignition. For pipework sizes above 32 mm nominal bore, a flare stack with permanent pilot shall be used and is located at a safe distance away from the bulk tanks and other vulnerable structures.

d) Care shall be taken to ensure removal of the inert gas (a stable flame at the flare stack) before terminating the flaring process.

7.10 Commissioning

7.10.1 All equipment, joints and valves, etc. shall be checked for leakage, integrity and proper function before commissioning.

7.10.2 LPG trap shall be checked to ensure that it is topped with water (see Appendix C).

7.10.3 The operation of fire service installations and equipment where fitted, shall be checked for its satisfactory performance, and a Fire Services Certificate (FS172) issued by the FSD should be obtained before putting the LPG installation into operation.
SECTION 8. OPERATIONS

8.1 General

8.1.1 Operating instructions shall be in place to ensure safe, continuing and reliable operation of the installation in supplying gas to consumers.

8.1.2 Persons engaged in LPG operation shall:

a) be provided with extensive training in their specific areas of responsibilities;
b) be thoroughly familiar with the properties of LPG;
c) have knowledge of and access to the appropriate codes of practice at all times;
d) have specific guidance on the instructions to be followed under emergency conditions;
e) be familiar with different types of fire fighting and fire control equipment, including fire extinguishers;
f) ensure that the LPG storage does not exceed its approved quantities; and

g) ensure that all fire extinguishers are clearly identified for their types and expiry dates.

8.2 Filling Operation

8.2.1 All filling operators should receive proper training on handling LPG and the dispensing equipment in the filling station. They should be fully conversant with the locations and operation of the remote emergency shut-down buttons and fire-fighting equipment, emergency procedures to shut down the dispensing system and action in an emergency such as a drive-away with the dispensing hose still connected to the vehicle.

8.2.2 Filling operators should wear protective gloves during refueling.

8.2.3 No untrained person should carry out refueling.

8.2.4 LPG vehicle with a defective filler cap or filler valve should not be refueled.

8.2.5 The filling operator shall ensure the vehicle ignition is switched off prior to the commencement of filling operation.

8.2.6 All LPG vehicles should not be left unattended during the filling operation.

8.2.7 The dispensing nozzle shall not be held open with any items such as rods, keys or any devices other than the integral component of the nozzle throughout the filling operation.

8.2.8 LPG vehicle refueling and road tanker operation could be performed at the same time.

8.2.9 Typical filling procedures are as follows:

a) Open filler cap at the vehicle body by turning counter clockwise.
b) Lift nozzle off hook from dispenser and wait for display to reset itself.
c) Ensure that no obstacle is in the passage between the nozzle and filler valve and align nozzle nose piece to filler valve properly.
d) Turn nose piece clockwise to fully engage nozzle to the filler valve.
e) Squeeze nozzle trigger to allow LPG to flow steadily. Flow will stop automatically when tank is 85% full.
f) Turn nozzle nose piece counter-clockwise to disengage the nozzle and place the nozzle back on hook of the dispenser.
g) Close the filler cap by turning clockwise.

8.3 Filling of Revalidated Tank for LPG Vehicle

Tank revalidation of LPG vehicles shall be carried out at intervals not exceeding 5 years in accordance with Gas Safety (Gas Supply) Regulations. LPG vehicle tanks are normally required to be detached from the vehicle for undertaking the relevant tests and examinations. The revalidated tanks may be brought to LPG filling stations by LPG vehicle workshop mechanics/competent persons for refilling service. The procedures below should be followed on refill of detached tanks for LPG vehicles:

a) When a person requests for filling of a detached LPG tank for LPG vehicle, the LPG filling station operator should ask the person to present a valid revalidation certificate so as to be satisfied that the tank has been tested and examined with satisfactory results in accordance with the Gas Safety (Gas Supply) Regulations.

b) The station operator should record details of the refilled LPG tank as well as the name of the LPG vehicle workshop and responsible mechanic/competent person for future reference.

c) The station operator should visually check and be satisfied with the conditions of the detached tank and its associated fittings before the refilling service.

d) The station operator should not fill the tank to more than 20% full.

8.4 Road Tanker Operation

8.4.1 Off-loading of LPG shall be carried out by at least 2 competent road tanker operators (see Gas Safety (Gas Supply) Regulation 39), one of whom may be the road tanker driver.

Note: In the case of extended fill-connection, the driver shall stay close to the road tanker to monitor off-loading while his assistant shall monitor the filling in progress at the LPG tank.

8.4.2 Persons engaged in off-loading of LPG shall be suitably trained in first aid, fire fighting, dispensing system of the filling station and emergency response.

8.4.3 Persons engaged in off-loading of LPG shall wear suitable protective clothing to avoid frostbite which can occur if LPG comes in contact with unprotected skin.

8.4.4 A reporting procedure shall be instituted to record every accidental LPG release, equipment failure or personal injury that may occur during the off-loading operation.

8.4.5 The following precautionary measures shall be observed throughout the LPG off-loading operation:

i. Simultaneous bulk deliveries of LPG and petrol or diesel are not permitted.

ii. The driver should position the tanker at the designated tanker bay facing the direction of departure so that it can be towed or driven straight out in an emergency.

iii. The hand brake of the road tanker shall be applied and the chock blocks securely fitted to undersides of the wheels.

iv. The surrounding shall be checked to ensure that neither source of ignition nor flammable material is present.

v. Earthing/bonding cable shall be engaged before connecting the fill-hose and be disengaged after disconnecting the fill-hose. Earthing/bonding cable and driveaway coupling shall be connected throughout the entire off-loading operation.

vi. Extended fill-connections shall be visually checked to ensure that they are in safe working conditions.

vii. The engine of the tanker may be running only if this is required for storage tank filling but only after the hose has been connected.
viii.  The driver should maintain a direct sight between the tanker and the filling point while off-loading.

ix.   The storage capacity of the tank to be filled shall be carefully monitored throughout the filling operation by means of the contents gauge to avoid over-filling. The storage tank shall never be filled beyond the maximum level (85%) as specified in Section 5.2.20 (see Gas Safety (Gas Supply) Regulation 10).

x.    Extended fill-connections and fill-hose shall be checked for leakage throughout the operation.

xi.   For installations of more than one tank, each tank shall be filled separately.

xii.  Fire extinguishers shall be located at easily accessible positions with warning notices prominently displayed (see Gas Safety (Gas Supply) Regulation 38(1)(b)).

8.5 General Housekeeping Procedures

Good housekeeping procedures, which shall include but not limited to the daily attention of the following activities, should be established by the filling station management. The competent person shall check the housekeeping records and carry out an inspection for the following items:

a)  The gas detection, LPG vehicle filling and fire fighting systems are under normal operation;

b)  No visual damage to the extended fill-connection, above-ground pipework and fittings, manhole covers of underground LPG storage tanks, valve pit and the associated instrumentation such as gas detector heads, remote emergency shut-down buttons, etc.;

c)  No visible damage to the dispensers, dispensing hoses, breakaway couplings and dispensing nozzles.

d)  Portable fire extinguishers for the filling station are kept in place and charged in particular the LPG tanks and dispensers;

e)  Warning signs are kept in a legible condition and in place;

f)  Price information board are kept in good condition for displaying the auto-LPG price;

g)  Rain caps for the vent pipes of pressure relief valves remain in place;

h)  Any accumulation of flammable or combustible materials especially around the road tanker unloading area, the storage tank area and the extended fill-connection, are removed;

i)  Illumination is kept operational and effective especially at the filling point and around the dispensing area;

j)  Vegetation (if any) which might become a fire hazard is kept short; and

k)  Drain cover and trap door should be properly sealed in dispensing and road tanker bays.

8.6 Emergency Procedure

8.6.1 Filling station management should formulate an emergency plan with which the operating personnel should be well conversant. This plan should contain instruction for emergency shut-down of the installation, warnings to customers and other people in the installation surroundings, call for assistance and use of fire-fighting equipment. The plan should be reviewed once a year.

8.6.2 A copy of updated site layout plan and schematic diagram of the LPG filling system shall be kept on site for operation and emergency uses.

8.6.3 In case of fire or serious leakage from the LPG filling facilities, the operators at the LPG filling stations should call FSD immediately by dialling 999.
8.6.4 Under safe condition, the following measures should be carried out to prevent escalation of the situation:

a) Shut off the LPG filling system by means of remote emergency shut-down buttons.
b) Switch off the main switch of electrical installation.
c) Remove or extinguish all sources of ignition.
d) Activate water spray system if it is not automatically operated.
e) Warn customers to switch off or not to start vehicle engines.
f) Inform the gas supply company using the emergency phone number.
g) Keep spectators at distance.
h) Alert neighbours to the danger.

8.6.5 Regular drills on communication and on site for different scenarios of LPG emergency cases should be carried out to ensure relevant emergency procedures to be current, comprehensive and effective and enable the station staff/management to familiarise with the emergency procedures.

8.6.6 For further details, refer to Code of Practice for Hong Kong LPG Industry, Module 7 – Operating Procedures for Emergencies for LPG Compounds and Cylinder Stores.

8.7 Auto-LPG Quality

8.7.1 LPG supplied to LPG filling station shall comply with the Gas Safety (Gas Quality) Regulations and meet the following specifications:

a) consisting predominantly of butane and propane, and containing no harmful quantities of toxic or nauseating substances;

b) containing no water, as ascertained by a visual examination of samples, at 15.6°C, taken from the bottom of the containers;

c) containing not more than 0.02% (by mass) total sulphur content (see the Gas Safety (Gas Quality) Regulations), to be tested by the method described in ANSI/ASTM D2784 or similar, after a tainting agent has been added; and

d) having a distinctive, unpleasant and non-persistent smell (irrespective of suppliers) at a dilution of 1:250 with air (approximately 20% Lower Explosive Limit), to be tested by the method described in BS 4250, or similar.

8.7.2 The auto-LPG to be supplied at the station shall conform to the detailed specification in Appendix H.

8.7.3 To facilitate monitoring of the compliance of Auto-LPG quality requirement, relevant document illustrating the gas quality, such as certificate of quality, for each shipment of LPG to be distributed to the station should be submitted to Gas Standards Office as soon as the document is available.
SECTION 9. PERIODIC INSPECTION & MAINTENANCE

9.1 General

9.1.1 The owner of an LPG installation shall have a duty to maintain and operate the installation in a safe condition and shall employ a competent person to inspect the installation at intervals as specified in Section 9.3 and 9.5.

9.1.2 Activities such as construction, repair, maintenance, inspection, testing and revalidation of the LPG installations shall be undertaken by competent persons.

9.1.3 Relevant tests on the LPG storage tanks and associated piping system (See Appendix I 1 or I 2) shall be supervised and certified by a competent person. (See Appendix B1 or B2).

9.1.4 Tests and examinations for revalidation of tanks, dispensers, pipework and associated fittings, etc. shall be carried out in accordance with the schedule in Appendix K. The schedule shall be planned well ahead to ensure timely completion of works.

9.1.5 Persons engaged in maintenance work shall have access to maintenance manuals and operating instructions and shall adhere to them accordingly.

9.1.6 No unauthorised person shall be permitted to gain access to LPG installations. A proper work permit system incorporating formal procedures shall be instituted for cold work, hot work and entry to bulk tanks.

9.1.7 Work permits shall be kept for 5 years as part of the maintenance records.

9.1.8 An annual inspection report (See Appendix J) on the safety conditions and housekeeping of the LPG filling station shall be prepared by a competent person and submitted to the Gas Authority for review.

9.1.9 Before re-commissioning, care shall be taken to ensure that all tanks, dispensers, equipment and associated pipework/fittings (including electrical bonding) are properly re-instated and leak tested satisfactorily.

9.1.10 All purging, testing and commissioning work shall be carried out by suitably trained and competent persons.

9.1.11 Purging to be carried out before and after any test and examination of the LPG installation shall be performed in accordance with the procedures and recommendations in Section 7.9 and 9.7.

9.1.12 Appropriate personal protective clothing and safety equipment including handheld/portable flammable gas detectors shall be used by people involved with LPG work.

9.1.13 Fire service installations and equipment of the station shall be made available during purging, testing and commissioning work.
9.2 Documentation and Records

9.2.1 A systematic routine maintenance plan shall be established by the owner of the station and be documented. The plan should contain detailed instructions on what maintenance items are to be carried out, the scope of works, the intervals at which, or the circumstance in which, such works shall be carried out. It should also be reviewed and updated as necessary.

Where preparing the plan, sufficient regards should be paid to the relevant standards employed, the manufacturer’s recommendations and the history and conditions of individual equipment.

9.2.2 All test/maintenance records and certificates shall be kept by the owner for the service life of the station.

9.2.3 The owner of the station shall submit a full set of test certificates as follows for tank revalidation signed by a competent person to the Gas Authority for review:

a) hydraulic test report with minimum test pressure 1.5 times the maximum design pressure;
b) external visual inspection report (internal inspection where necessary);
c) plate thickness ultrasonic test report;
d) magnetic particle test report for welding seams;
e) test and examination of the vessel fittings including pressure gauges;
f) paint thickness test and holiday test report;
g) cathodic protection test report;
h) earthing impedance report;
i) electrical continuity test report;
j) test report for electrical isolation of insulation flange;
k) pressure relief valves pressure test certificates; and
l) pipework pressure test report.

9.2.4 The owner of the station shall submit an annual inspection report (See Appendix J) to the Gas Authority within 4 weeks after the inspection.

9.3 Revalidation of LPG Storage Tank

9.3.1 Each LPG storage tank shall be revalidated once within the first 10 years and then every 5 years thereafter (see Gas Safety (Gas Supply) Regulation 8(4)). A full set of test certificates as specified in Clause 9.2.3 for tank revalidation signed by a competent person shall be submitted to the Gas Authority for review.

9.3.2 For visual examination of LPG storage tanks, special attention shall be given to signs of corrosion, deterioration, condition of tank supports and welded joints. Any defects shall be rectified prior to re-commissioning of the LPG storage tanks (see Gas Safety (Gas Supply) Regulation 8(6)).

9.3.3 All excess flow valves associated with the LPG storage tank shall be reconditioned/replaced and functional tested during revalidation.

9.3.4 The pressure relief valve of each LPG storage tank shall be replaced with a new or reconditioned unit of appropriate set pressure and capacity every 5 years.

9.3.5 The submersible pump in the LPG storage tank shall be inspected, tested or replaced at regular intervals as recommended by the equipment manufacturer.
9.3.6 The hydrostatic pressure relief valves at the liquid sections should be replaced with new or reconditioned units of appropriate set pressure and capacity every 10 years.

9.3.7 All LPG pipework whether it is new, modified or reinstated after disconnection shall be hydraulically tested at 1.1 times the HPRV setting. Elements that could be damaged by the test pressure shall be isolated and time shall be allowed for temperature stabilisation during pressure testing. After the hydraulic test is completed, all isolated elements shall be properly installed and the whole system shall be tested pneumatically at a minimum pressure of 1378 kPa (200 psig).

9.3.8 All exposed LPG pipework other than those of Clause 9.3.7 shall be subject to annual visual examination and leak test under operating pressure using soap solution.

9.3.9 All underground LPG pipework shall be re-tested once within the first 10 years and then every 5 years thereafter in accordance with those specified in Clause 9.3.7.

9.3.10 The test period for all hydraulic and pneumatic pressure tests shall be of a minimum of 30 minutes after temperature stabilisation and there shall be no sign of pressure decay during this period.

9.3.11 A copy of test certificate signed by a competent person should be submitted to the Gas Authority for review upon completion of the pressure tests as specified in Clauses 9.3.7 to 9.3.9.

9.3.12 Test report on the pipework pressure tests (See Appendix I 2) shall include the following:
   a) name of contractor, and signature of the competent person who supervised the tests;
   b) test date;
   c) maximum working pressure;
   d) test pressure, medium and duration;
   e) test results; and
   f) material, rating and specification of pipework and fittings.

9.3.13 Test reports on the cathodic protection of LPG storage tank at intervals of 6 months shall be kept by the owner of the LPG filling station. A record of these tests shall be kept for whole life of the tank and made available to the Gas Authority for review upon request. (See Gas Safety (Gas Supply) Regulation 12(2)).

9.3.14 The electrical and fire service installations of the filling station shall be regularly inspected and tested by competent persons in compliance with the statutory regulations.

9.4 Maintenance

9.4.1 The owner of the LPG filling station shall maintain the station in a safe manner by carrying out regular inspections and maintenance works of the LPG filling facilities at intervals not less than that as recommended by the equipment manufacturer.

9.4.2 Maintenance and repair work shall be carried out by suitably trained and competent persons.

9.4.3 Routine maintenance schedule shall be planned in accordance with manufacturer instructions to ensure safety and proper function of the system. The schedule may also depend on the individual site condition and past maintenance records.

9.4.4 Site environment shall be maintained in good condition so that it is free of overgrown vegetation and irrelevant materials.

9.4.5 Identification labels, emergency instructions, warning signs and line diagrams shall be checked to ensure that they are in place and legible.
9.4.6 Any work which is likely to create an ignition source shall not be permitted within a Zone 0 area or a Zone 1 area and shall not be carried out in a Zone 2 area unless the area is subject to continuous checking to ensure that it is gas-free.

9.4.7 Any pit associated with an underground LPG installation shall be checked for the presence of LPG before commencement of any work in the pit.

9.4.8 A logbook detailing all maintenance and repair works that have been carried out shall be kept by the owner for the service life of the installation.

9.4.9 The LPG submersible pump and the associated control equipment shall be inspected and properly maintained at regular intervals according to manufacturer's instructions.

9.4.10 All other equipment and instrumentation such as pressure and contents gauges, etc. shall be checked and maintained to ensure satisfactory condition and proper function in accordance with manufacturer instructions at intervals not exceeding one year as practicable and replaced with new or reconditioned units as necessary.

9.4.11 Vessel chambers and valve chambers shall be checked for integrity and be properly maintained at regular intervals to prevent ingress of water.

9.4.12 The dispenser and its components such as the metering unit, excess flow valve, breakaway coupling, dispensing hose, nozzle, strainer and pipework shall be properly maintained at regular intervals as recommended by the equipment manufacturer.

9.4.13 All connections, pipe joints, seals and associated fittings inside the dispenser cabinet, the dispensing hose joints, breakaway coupling and dispensing nozzle shall be subject to visual examination and leak test carried out by the competent person under operating pressure using soap solution annually.

9.4.14 The dispensing hoses and couplings shall be replaced at an interval not more than 5 years.

9.4.15 All seals (e.g. mechanical seal, lip seal, O ring and seal ring) of the dispenser and dispensing nozzle shall be replaced at regular intervals as recommended by the equipment manufacturer.

9.4.16 Identification labels shall be checked to ensure they are in place and legible.

9.4.17 The earthing and bonding arrangement shall be checked and maintained at regular intervals to ensure its proper function.

9.4.18 Each electrical equipment and cable connection shall be inspected and properly maintained to ensure satisfactory condition in accordance with manufacturer instructions.

9.4.19 The emergency shut-down system and gas detection system should be regularly maintained and tested at intervals as recommended by the equipment manufacturers.

9.4.20 The fire service installations or equipment of the station shall be maintained in efficient working order at all times and shall be inspected by a registered fire service installation contractor at least once in every 12 months.

9.4.21 The remote emergency shut-down system including the buttons and valves shall be tested annually.

9.4.22 The gas detection system shall be maintained in efficient working order at all times and shall be inspected by a registered fire service installation contractor at least once in every 12 months. The battery for the gas detection system shall be checked and replaced if necessary. All the gas detector heads shall be calibrated by relevant competent person/contractor to ensure satisfactory condition and proper functioning in accordance with manufacturer instructions at intervals not exceeding one year.
9.5 **Annual Inspection**

9.5.1 An LPG filling station shall be inspected annually by a competent person (Class 2) to ascertain that the installation is maintained and operated in a safe manner and it complies with the requirements of this Code of Practice at all times. The owner of the station shall submit an annual inspection report (See Appendix J) to the Gas Authority within 4 weeks after the inspection.

9.5.2 The owner of the LPG filling station shall carry out the necessary work as identified in the inspection reports.

9.6 **Alteration to LPG Filling Facilities**

In accordance with regulation 4 of the Gas Safety (Gas Supply) Regulations, modifications of LPG equipment in the station shall not be made without the approval from the Gas Authority.

9.7 **Purging out of Service**

9.7.1 The procedure for purging out of service of an LPG installation using inert gas is as follows:

a) LPG in a bulk tank shall be depleted as far as practicable through normal consumption or decanted to a road tanker prior to purging.

b) The bulk tank to be purged shall be properly isolated and blanked off from other tanks and/or pipework.

c) A flare stack with a permanent pilot, located in a safe area, shall be connected to a suitable vapour connection of the tank for flaring of the residual LPG.

d) The flaring process shall be attended to at all times during purging.

e) Inert gas (e.g. N2) shall be introduced into the top of the bulk tank. Care shall be taken by means of a combustible gas detector to ensure complete removal of LPG before terminating the flaring process. In this case, the LPG content of the purged gas mixture shall be less than 5%.

f) Once the bulk tank is at atmospheric pressure, the manhole cover may then be removed and air be introduced into the tank.

g) No one shall enter into the tank until the internal atmosphere has been verified to be safe (LPG level less than 5% of the lower explosive limit and oxygen level not less than 18%). Detector probes shall be used to ensure that LPG is not present at the bottom of the tank and oxygen level is adequate inside every part of the tank.

9.7.2 Water can be used as a medium for purging instead of inert gas. The procedure shall be the same as per Section 9.7.1 except that water is introduced into the bottom of the bulk tank.
SECTION 10. FIRE SERVICE REQUIREMENTS

10.1 General

10.1.1 Building plans including the fire service installations should be submitted to the Building Authority for approval under the Buildings Ordinance Cap. 123. In case there is no building works and plans are not submitted to the Building Authority, plans showing fire service installations should be submitted to the Gas Authority. All fire service installations and equipment shall be designed and installed to the standards acceptable to the Director of Fire Services and/or the Gas Authority.

10.1.2 Fire service installations and equipment shall be installed, maintained, repaired, inspected and tested by registered fire service installations contractors of appropriate class.

10.1.3 Relevant requirements stipulated by the Gas Authority when and where required shall be complied with.

10.1.4 All requirements in this Section are for general guidelines only. Detailed fire service requirements will be formulated upon receipt of formal submission of building plans or referral from licensing authority.

10.2 Dedicated LPG Filling Station

10.2.1 An automatic water spray system shall be provided to cover the surface area of the LPG dispensers and the fill connections of both the LPG road tanker and the underground LPG storage tank in accordance with NFPA 15 or standards acceptable to the Director of Fire Services. Such system shall be automatically actuated by gas detectors and/or fire detectors and shall also have a capability for manual actuation.

10.2.2 A fire hose reel system shall be installed in accordance with the standards acceptable to the Director of Fire Services.

10.2.3 A street fire hydrant shall be provided within 100m from the station.

10.2.4 A Liquefied Petroleum Gas detection system shall be installed not more than 150mm above ground level adjacent to the inside boundary of the filling station to give warning of the presence of leaked/spilt Liquefied Petroleum Gas.

10.2.5 A direct link connection shall be provided for connecting all fire/gas detection systems and fire suppression systems to the Fire Services Communication Centre or such other premises as may be agreed with the Director of Fire Services.

10.2.6 One “Cat.2 DG” plate to be provided and firmly fixed on the external wall of the sales office.

10.2.7 Portable fire fighting equipment of approved type shall be provided in the following scale:
- 2 x 9 kg dry powder fire extinguisher for each LPG storage tank.
- 1 x 4.5 kg dry powder fire extinguisher for each dispensing pump.

10.2.8 “LPG – HIGHLY FLAMMABLE” (石油氣-高度易燃), “NO SMOKING - NO NAKED LIGHTS” (不准吸煙-不准明火) signs in block letters and characters of not less than 125mm high and 15mm strokes shall be provided at conspicuous locations to give warning to customers.

10.2.9 “SWITCH – OFF ENGINE” (關掉引擎) signs of similar dimensions as for “NO SMOKING – NO NAKED LIGHTS” (不准吸煙-不准明火) signs shall be provided near dispensing units to give warning to customers.
10.2.10 Other Building Fire Service Installations and Equipment formulated by the Fire Services Department upon receiving building plans through Buildings Department shall be complied with.

10.2.11 “LPG FILLING STATION” (石油氣加氣站) signs in block letters and characters of not less than 150mm high and 20mm strokes shall be provided in conspicuous locations within the station area.

10.2.12 No cooking shall be permitted within the station boundary.

10.3 Petrol-Cum-LPG Filling Station

10.3.1 A water spray system shall be provided to protect the hose reach zones of the Liquefied Petroleum Gas dispensers, and the filling connections of both the Liquefied Petroleum Gas road tanker and the underground Liquefied Petroleum Gas tanks in accordance with NFPA 15 or the standards acceptable to the Director of Fire Services. Such system shall be automatically actuated by Liquefied Petroleum Gas detectors and/or fire detectors and shall also have a capability for manual actuation.

10.3.2 A fire hose reel system shall be installed in accordance with the standards acceptable to the Director of Fire Services.

10.3.3 A street fire hydrant shall be provided within 100m from the station.

10.3.4 A Liquefied Petroleum Gas detection system shall be installed not more than 150mm above ground level adjacent to the inside boundary of the filling station to give warning of the presence of leaked/spilt Liquefied Petroleum Gas.

10.3.5 A direct link connection shall be provided for connecting all fire/gas detection systems and fire suppression systems to the Fire Services Communication Centre or such other premises as may be agreed with the Director of Fire Services.

10.3.6 Portable fire fighting equipment of approved type shall be provided in the following scale:
- 2 x 9 kg dry powder fire extinguisher for each LPG storage tank.
- 1 x 4.5 kg dry powder fire extinguisher for each dispensing unit.

10.3.7 “LPG – HIGHLY FLAMMABLE” (石油氣-高度易燃), “NO SMOKING – NO NAKED LIGHTS” (不准吸煙-不准明火) signs in block letters and characters of not less than 125mm high and 15mm strokes shall be provided at conspicuous locations to give warning to customers.

10.3.8 “SWITCH – OFF ENGINE” (關掉引擎) signs of similar dimensions as for “NO SMOKING – NO NAKED LIGHTS” (不准吸煙-不准明火) signs shall be provided near dispensing units to give warning to customers.

10.3.9 Other Building Fire Service Installations and Equipment formulated by Fire Services Department upon receiving building plans through Buildings Department shall be complied with.

10.3.10 Apart from the existing “Cat. 5 DG” plate, one “Cat.2 DG” plate shall be provided and firmly fixed on the external wall of the sales office.

10.3.11 “PETROL-CUM-LPG FILLING STATION” (石油氣加氣站/加油站) signs in block letters and characters of not less than 150mm high and 20mm strokes shall be provided in conspicuous locations within the co-existing station area.

10.3.12 No cooking shall be permitted within the station boundary.

10.3.13 The separating zoning in between Liquefied Petroleum Gas and Petrol filling station shall be marked in yellow reflective paint diagonal stripes of 120mm in width for demarcating purpose.

10.3.14 Other Fire service requirements applicable to Petrol Filling Station shall be complied with.
SECTION 11. INCIDENT REPORTING AND INVESTIGATION

11.1 General

11.1.1 An accident in which there is significant damage to LPG installation, or loss of containment of LPG within the station is considered as a “major gas emergency”.

11.1.2 All LPG incidents and major gas emergency occurred within the station shall be notified to the Gas Authority within the next working day.

11.1.3 All LPG incidents shall be rectified by suitably trained and competent person as soon as practicable.

11.1.4 The causes of the incidents shall be investigated thoroughly and preventive measures shall be implemented to avoid recurrence of similar incidents.

11.1.5 The owner or gas supply company of the station shall keep a record of the preliminary and detailed incident report and retain the record for not less than 2 years after the reports are made.

11.1.6 For further details, refer to Code of Practice for Hong Kong LPG Industry, Module 7 – Operating Procedures for Emergencies for LPG Compounds and Cylinder Stores.

11.2 Reporting of LPG Incidents

11.2.1 The owner or gas supply company of the station shall notify all LPG incidents within the station to the Gas Authority not later than the next working day after the incident occurs.

11.2.2 The incidents required to be reported include, but not limited to, the following categories:
   a) LPG leakage;
   b) Fire;
   c) Damage of any LPG equipment;
   d) Injury of customers or station staff;
   e) Vehicle Drive-away with or without LPG leakage;
   f) Interruption of LPG supply;
   g) Other incidents which cause closure of the station or nozzles.

11.2.3 The owner or gas supply company of the station shall submit a preliminary incident report with the following information within two working days.
   a) the date and time of the incident;
   b) the location of the incident;
   c) summary of the incident;
   d) the suspected/preliminary cause of the incident;
   e) the identification number of the gas detectors which were activated during the incidents;
f) the extent of the damage of the concerned equipment or parts;
g) the licence number of the LPG vehicle involved and contact details of the driver;
h) the time when maintenance/emergency personnel arrived at the place of the incident;
i) the action taken by such personnel to deal with the incident; and
j) the rectification time for the incident and service restoration time.

11.2.4 The owner or gas supply company of the station shall submit a detailed incident report with the following information in addition to the items in Section 11.2.3 not later than seven working days after the incident occurs.

a) the extent of the damage of the concerned equipment or parts;
b) the date and time of despatch of personnel to deal with the incident;
c) the time when such personnel arrived at the place of the incident;
d) the actions taken by such personnel to deal with the incident;
e) the causes of the incident; and
f) the proposed measures to prevent recurrence of similar incident.

11.3 Reporting of Major Gas Emergencies

11.3.1 Where there is a major gas emergency, the owner or gas supply company of the station concerned shall:

a) notify the Gas Authority within the next working day after the emergency occurs.
b) provide the Gas Authority with such information and details in relation to the major gas emergency as the Gas Authority requires; and
c) not later than 28 days after the occurrence of the major gas emergency, furnish the Gas Authority with a written report stating, so far as is reasonably practicable:-

(i) the cause of the emergency; and
(ii) the actions which are or have been implemented to prevent, so far as is reasonably practicable, the recurrence of any similar emergency.
### APPENDIX A  RELEVANT SECTIONS IN RELATION TO THE GAS SAFETY (GAS SUPPLY) REGULATIONS & THE GAS SAFETY (GAS QUALITY) REGULATIONS

APPENDIX B1  ACCEPTANCE CRITERIA FOR ENLISTMENT
BY THE GAS AUTHORITY AS COMPETENT PERSON

Class 1(a) - Testing and certification of LPG tanks, vaporisers and mains OR
Class 1(b) – Testing and certification of LPG cylinders

1. Responsibilities
   (a) For testing and certification of LPG tanks, vaporisers and mains
      LPG Tanks
      • Visual inspections of LPG tanks prior to testing.
      • Supervise pressure testing of LPG tanks.
      • Ensure that non-destructive testing and examination of LPG tanks are carried out in accordance with appropriate procedures and vessel codes.
      • Certify that they are suitable for LPG service.

      LPG Vaporisers and Mains
      • Ensure that pressure testing of LPG vaporisers/mains is carried out in accordance with appropriate procedures and codes.
      • Certify that tested LPG vaporisers/mains meet the required standards.

   (b) For testing and certification of LPG cylinders
      LPG Cylinders
      • Ensure that LPG cylinders are inspected and tested in the prescribed manner.
      • Certify that tested LPG cylinders meet the required standards.

2. Qualification
   Corporate Member of the Hong Kong Institution of Engineers in the Mechanical, Chemical, Gas or Marine & Naval Architecture disciplines; or equivalent professional attainment such as Corporate Member of the Institution of Mechanical Engineers, Institution of Chemical Engineers, Institution of Gas Engineers and Managers or Institution of Marine Engineering, Science & Technology.
3. **Knowledge and Working Experience Required**

(a) **To carry out testing and certification of LPG tanks, vaporisers and mains**

Have full understanding of the following subjects:

- Design codes and test standards pertaining to LPG tanks, vaporisers, mains, valves and associated equipment.
- Non-destructive testing technology applicable to LPG tanks, vaporisers and mains;
- Strength of materials and other properties of materials used on LPG tanks, vaporisers and mains;
- Properties of LPG and related Codes of practices and Guidelines; and

Possess at least 1-year relevant working experience in the testing of pressure vessels.

(b) **To carry out testing and certification of LPG cylinders**

Have full understanding of the following subjects:

- Design codes and test standards pertaining to LPG cylinders and associated equipment.
- Non-destructive testing technology applicable to LPG cylinders.
- Strength of materials and other properties of materials used on LPG cylinders.
- Properties of LPG and related Codes of practices and Guidelines; and

Possess at least 1-year relevant working experience in the testing of cylinders.
(i) According to the interpretation as stated in the Gas Safety Ordinance (Cap 51),

"Tank" means a bulk tank or mini-tank; "Bulk tank" means a receptacle which has a water capacity of more than 450 litres and used, or to be used, to contain liquefied petroleum gas; "Mini-tank" means a receptacle with a water capacity of more than 150 litres but not more than 450 litres and used, or to be used, to contain liquefied petroleum gas;
"Vaporiser" means any equipment used, or to be used, to provide heat for the vaporisation of liquefied petroleum gas;
"Gas main" means a pipe, other than a service pipe or installation pipe, used, or to be used, to supply gas;
"Cylinder" means a receptacle which has a water capacity of not more than 150 litres; and used, or to be used, to contain liquefied petroleum gas.

(ii) The applicant may submit, together with the application form, relevant documentary proof such as training records or employer references in respect of his/her training and experience in the testing of pressure vessels/ cylinders.

(iii) The Gas Authority may require the applicant to attend an interview for verifying the appropriateness of his/her training and experience.

(iv) For an applicant who is a Registered Professional Engineer in the Mechanical, Chemical, Gas or Marine & Naval Architecture Disciplines under the Engineers Registration Ordinance (Cap 409), interview may not be required if his/her submitted application form is accompanied with adequate documentary proof in respect of his/her training and experience in the testing of pressure vessels/ cylinders.

(v) The performance of all competent person of Class 1(a) and Class 1(b) shall be subjected to the monitoring of a performance monitoring system of which details are listed in EMSD website http://www.emsd.gov.hk/emsd/eng/pps/gas_pms.shtml.

(vi) When a competent person ceases to practise in the gas industry for 12 months or ceases to maintain any professional qualification in Mechanical, Chemical, Gas or Marine & Naval Architecture Disciplines, his/her name may be removed from the register.

(vii) If a competent person changes his/her employer within the gas industry or correspondence address or ceases to maintain any professional qualification in Mechanical, Chemical, Gas or Marine & Naval Architecture Disciplines, he/she shall notify the Gas Authority of the change within 28 days.
APPENDIX B2  ACCEPTANCE CRITERIA FOR COMPETENT PERSON UNDER
GAS SAFETY ORDINANCE, CAP. 51

Class 2 - Inspection and Certification of
LPG Compounds and Cylinder Stores

1. **Responsibilities**

(a) Inspect LPG compounds and cylinder stores to ensure that they are
maintained and operated in accordance with the requirements under the
Gas Safety Ordinance and relevant codes of practice.
(b) Ensure proper record of maintenance, repair and alteration works.
(c) Prepare reports for periodic inspection of LPG installations.

2. **Knowledge Required**

Must have a full understanding of the following subjects :-

(a) The Gas Safety Ordinance and subsidiary regulations.
(b) Design codes and standards pertaining to LPG compounds and cylinder
stores.

3. **Acceptance Criteria**

Applicants must :

(a) be qualified to any one of the following professions or equivalent
professional attainment with at least 1 year of relevant working
experience :
   (i) Corporate Member of the Hong Kong Institution of Engineers in the
       Mechanical, Chemical, Marine, or Gas Engineering disciplines;
   (ii) Corporate Member of one of the following : Institution of
       Mechanical Engineers, Institution of Chemical Engineers, Institution
       of Marine Engineers, or Institution of Gas Engineers and Managers; or
(b) have a recognised degree in mechanical, chemical, marine or gas
    engineering with at least 5 years of relevant working experience; or
(c) have a recognised higher diploma or high certificate in mechanical,
    chemical, marine or gas engineering with at least 10 years of relevant
    working experience.

Notes :-

(i) The Gas Authority may require the applicant to attend an interview for verifying
    the appropriateness of his/her training and experience. Applicant who is not a
    Corporate Member of any appropriate professional institution may be required to
    sit for a written examination.
(ii) When a competent person ceases to practise in the gas industry for 12 months,
    his/her name may be removed from the register.
(iii) If a competent person changes his/her employer within the gas industry, he/she
    shall notify the Gas Authority of the change within 28 days.
APPENDIX C  TYPICAL DESIGN FOR LPG TRAP

Sample Calculation of LPG Trap

\[ h_3 \] is the required height of the trap to prevent overspilling LPG through the trap to the sewage system. It is calculated based on that if \( h_2 \) is filled with water and \( h_1 \) is filled to grade with liquid LPG, the water in \( h_3 \) can balance the LPG in \( h_1 \) and thus in a no flow position.

\[
H_3 \times \text{S.G. of water} = h_2 \times \text{S.G. of water} + h_1 \times \text{S.G. of LPG}
\]

\[
h_3 = h_2 + h_1 \times \frac{\text{S.G. of LPG}}{\text{S.G. of water}}
\]

Notes on Calculation:

(1) The foregoing does not account for additional head of LPG above grade. Assuming a liquid spill, the height of the assumed layer above grade shall be added to the above calculation.

(2) If there is no LPG, \( h_2 = h_3 \).

(3) S.G. = Specific Gravity
Schematic Diagram for LPG Filling Station

- Dispensing Hose
- Breakaway Coupling
- LPG Dispenser

1. I am of the opinion that at the time of inspection the general condition of the LPG installation was/ was not* satisfactory.

2. I recommend

Remark: The owner of LPG Installation should inform the Gas Standards Office in writing upon completion of the remedial work.

Note: Please use additional sheets if necessary.

Section IV - Declaration

(A) Competent Person

This is to certify that the above installation was inspected on ____________________ by ____________________

(Date)

________________________ of ____________________

(Competent Person) (Company Name)

and the foregoing is a correct report of the results of the inspection.

Signature: __________________________ Company Chop: __________________________

(B) Owner

I/We hereby submit an inspection report of the above installation in accordance with Regulation 6C of Part IIA of the Gas Safety (Gas Supply) Regulations, Cap. 51.

Date of Submission: __________________________ Signature: __________________________

(Name:________________________)

Contact Telephone No.: __________________________

Explanatory Notes:

1. This report is to be used for annual inspection of LPG installation referred to in paragraph (f) of ‘notifiable gas installation’ interpretation, as stated under Part I Section 2 of the Gas Safety Ordinance, Chapter 51.

2. The owner shall employ a competent person to inspect the LPG installation annually. The competent person should complete appropriate Sections I, II, III(A) & IV(A) of the report and the owner should complete Sections III(B) & IV(B) of the report. The report shall be kept by the owner for the service life of the installation.

3. The owner shall submit a copy of the report to Gas Standards Office, Electrical & Mechanical Services Department, 3 Kai Shing Street, Kowloon, Hong Kong by mail or by fax (2576 5945) within 4 weeks after the inspection.

4. The owner shall carry out the necessary remedial work on the LPG installation as recommended in the inspection report.

5. Failure to comply with the requirements of inspection by a competent person and/or the requirement of submission of inspection report is an offence and the owner is liable on conviction to a fine of $5,000.
